

# ApexSQL Clean 2011

## for SQL Server

Analyze dependencies and remove unused objects

Data Sheet

ApexSQL Clean is a dependency analysis tool that exposes object relationships. It detects ALL object interdependencies and enables you to safely remove unreferenced objects from your databases

### Highlights

#### Change impact analysis

Analyze the impact of potential changes and deletions on your database

#### Cross-environment relationship tracking

Determine objects' interrelationships within the database, across databases, scripts and even applications

#### Accurate dependencies

Recognize all object interdependencies, even those that even SQL Server itself fails to identify

#### Graphical relationships

Visualize even the most complex relationships between objects

#### Clean-up scripts

Remove unwanted objects without problems or errors

#### Selective analysis

Specify processing criteria. Check or ignore the relationships for specific objects

#### Automation

Schedule unattended dependency checking, using the command line interface

#### Reporting

Create end-user reports to document the interdependencies in your environments

"APEX SQL Clean did work quite well for me and definitely solved a major problem for my client. I currently have it listed as "My new favorite utility" and have told several people about it."

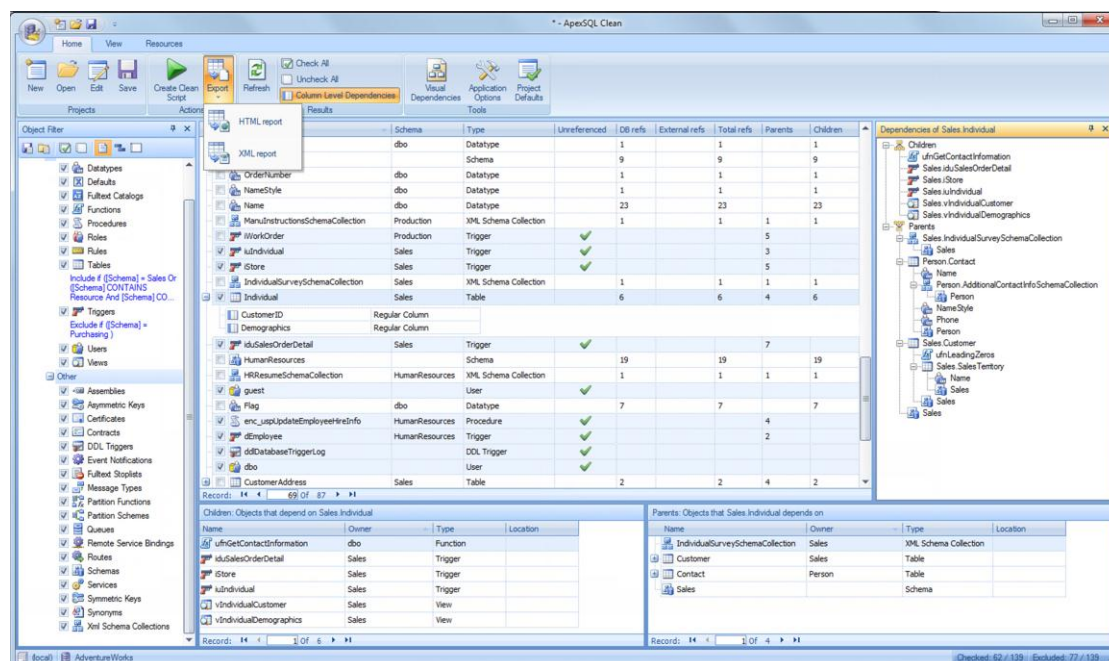

**Ron Patrick**  
President  
NTSG

"Apex SQL is truly an amazing piece of software. We've used Erwin, Embarcadero, and Visio for our needs in the past and Apex SQL is easier to use, more stable, and a fraction of the cost. It has totally changed the way we interact with our SQL databases. Feel free to use us as a testimonial if you'd like. Thanks for a great product! We've got a little while left in our trial, but will definitely be ordering soon."

**John Craven**  
President  
Prezza Technologies, Inc.

"A word of congratulations. I think that your suite is some of the best stuff I have ever used..."

**Cameron Townshend**  
Executive Consultant  
ISG Technology

# ApexSQL Clean 2011 for SQL Server

Analyze dependencies and remove unused objects

## Advanced Features

### Column-level dependencies

Track dependencies down to the column level

### Application impact

Determine how SQL objects changes affect your application

### Pre-impact analysis

Review the impact of the clean-up script before it is executed

### Transparent decryption

Isolate encrypted objects' interdependencies

### Granular filtering

Selectively limit what will be processed with advanced visual filtering

### Sophisticated reporting

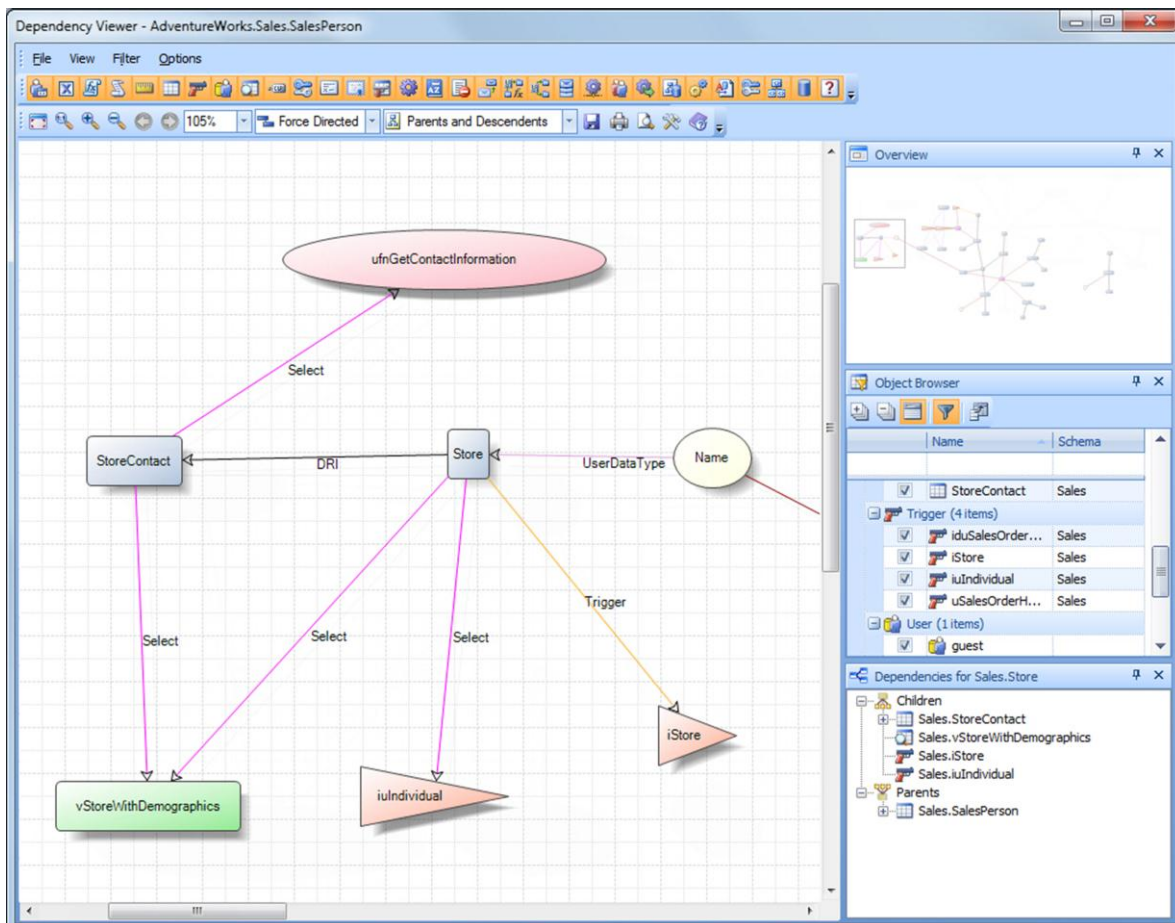

Export the comparison results to HTML or XML

### Repeatable sessions

Save your options to a project for instant re-execution

### Full SQL Server version support

Determine the relationships between all SQL Denali, SQL 2008 R2, SQL 2008, SQL 2005, and SQL 2000 objects
